Challenge 2 - Warming Up with some Image Classification

Hello, When calling trainer.train_project and training was already done at least once, ✏
error message is misleading. The message received is "Bad request". On the Custom
Vision site you will see helpful message "Training not needed Nothing has changed
since previous training"

Challenge 5 - A Run in the Clouds

Was not apparent to the team that we needed to change kernel in jupyter to ✏
AzureML. As a result team produced environment using conda. The benefits of
AzureML was eventually realized, but would be more positive/encouraging
experience to have greater awareness of that step early.

When programmatically creating a ContainerImage, our 'image' object did not ✏
automatically get an updated state. This triggered a failure when trying to do
Webservice.deploy_from_image(). We had to manually run
image.update_creation_state(). I would have expected this to be automatically
polling or registered as a callback
